

White paper pool party finance

The Pool Party Ecosystem Finance is a DEX on the BSC network . But what is the concept of DEX? And why are they much safer than any broker?

The answer is simple, they are managed through smart contracts created on a certain blockchain , through connections with users' wallets, the concept of which gained fame with decentralized finance (DeFi). Traditional exchanges are not 100% secure against hackers and other types of scams, for this reason, decentralized exchanges (DEX) work as a safer and less invasive alternative for those who want discretion and privacy, just like Dex . PoolPartyFinance , which in addition to PoolToken , can transact any other crypto with the lowest rates on the market, has Farms , Pools, Lottery, Syrups, NFT Games and a wide Casino.

Pool Party Finance is a community-powered ecosystem that aims to give people control of their finances through its core public service offerings.

- PoolParty Swap : a DEX based on an automated market making mechanism. a pool party finance is a decentralized platform and as such we always encourage the use of DEX.

- PoolParty Automated Order : An AMM-based automated order engine that can be configured to automatically execute orders in queue order when they reach a predetermined execution price. Provides arbitrageurs with automated tools to improve the AMM pricing mechanism.

- PoolParty smart Route : PoolParty 's intelligent inter-chain routing of orders allows automatic selection of multiple liquidity pools from the mainnet. Support for more pairs and less slippage.

- PoolParty Farm : is a great way to earn MSC in Pool Party Finance . Unlike Syrup Pools, Farms require you to wager two tokens to get LP Tokens, it's more complex. For a particular Farm on the platform, you need to enter the LP (Liquidity Provider) token specific to the token of the desired farm . After blocking funds and receiving LP tokens, you can farm them to yield more MSC. The strategy works as a double stake , or as a loan to leverage profits in case of a rise in the price of the LP token. FARM may give better rewards than staking , but has the risk of impermanent Loss (impermanent loss). It's not as scary as it sounds, but it's worth learning about what impermanent loss is and its risks.

- PoolParty Staking / Syrups : Staking consists of keeping cryptocurrencies locked for a certain period of time on the network in exchange for a REMUNERATE PERCENTAGE (APR - Annual Percentage Rate). Here at Pool Party Finance you have the freedom to exit any Staking whenever you want .

- Define gaming and lottery .

The Lottery : It works from a random and proven algorithm provided by Chainlink , where the minimum bet is 180 Pools and the draw takes place every 2 weeks, in which the winner takes 95% of the JackPot and 5% is for maintenance.

The Defi game is under construction along with its metaverse .

- Marketplace :

- MARKETPLACE POOLPARTYFINANCE:
Ability to Create NFTs on Binance Smart Chain with a royalty fee applied to all future sales
- ability for users to create profiles and sell NFTs (their own profiles with historical data)
- ability to send tips to designers/creators
- ability to buy NFTs via BNB
- ability to search for work by "title"
- ability to search creator by "name" or "wallet address"
- ability to follow artists and see a "followed" list on their profile

- Academy : An academic environment, with articles and videos that aim to teach all the pillars not only of DEFIS but of the entire cryptography universe.

The experience of DEX users is still very different from that of CEX. Users who are familiar with traditional financial market trading or centralized digital currency exchange may have a learning curve when starting out using a decentralized exchange.

The reliance of many current DeFi applications on Ethereum contracts has led to congestion on the Ethereum network , compounded by the lack of mature cross-chain support. However, other active networks have a strong motivation to participate in DeFi, which leads to the fragmentation of the DeFi market . Although DeFi has given rise to the rapid growth of - chain assets such as renBTC , WBTC, tBTC , etc. , only the most conventional assets offer cross-chain matching solutions. Because many digital assets cannot be mapped onto Ethereum there is a need for the formation of a unified and widely supported DeFi marketplace .

The solution proposed by PoolParty finance

Offering a DeFi platform on the BSC network (Binance Smart Chain), freeing users from the gas war of the Ethereum Network , will be a disruptive milestone in the DeFi world, in addition to the fact that the platform has three tokens, for three types of pool party investors finance the opportunity for other tokens to use it to generate revenue for their holders .

Swap at the Pool Party Finance allows anyone to inject liquidity into the Pool Party Pool and make a profit. Trader supports fewer order types compared to the book model order.

Automated order PoolParty provides the ability to enrich order types in the AMM engine, from limit orders to final orders, and even automated arbitrage based on them PoolParty Swap will determine the best pool of liquidity to use based more on the pairs the Trader is trading. trading and order sizes.

In a second phase of PoolParty smart Route will enable orders via intelligent inter-chain routing with automatic selection of multiple liquidity pools from the main network. Between the exchange of on-chain assets

will be achieved through anchoring the underlying assets of the main network on the BSC

- Reflective Token - TOKEN POOL

Reflection - Syrups Token

POOL TOKEN is a governance token where 20% of the initial revenue will be used to buy back and burn MSC\$ and fund higher investment options, it is also a third generation token where 5% is used for liquidity and 5% for all transactions go back to the holders, automatically by smart contract, so the volume provides an ideal incentive to accelerate adoption and drive new use cases, allowing users to receive tokens within their own wallet. There's an anti-whale system where there's a maximum token transaction, so you can't have someone just dump your tokens at night.

Its most notable features include reflection, acquiring LP Tokens, and burning. This token cannot be given as a reward, this is because it is deflationary with redistribution to holders. Based on each transaction, there is a tax. Redistribution comes from this tax and the same for liquidity. This automatic

redistribution can promote scarcity by reducing total supply. Together, the combination of these tokenomics can allow the token to increase in value.

2. Reflected finance token .

RFI static rewards, automated liquidity provisions and automatic token burning.

2.1 POOL TOKEN has a liquidity generating mechanism.

Here part of the liquidity can be taken as a function of the smart contract using the market activity of all swaps and transfers. A part of these exchanges and transfers will be captured by the smart contract and used with the function: " SwapAndLiquify ". For this to happen, the portion of the 3% swap and transfer fee can be autonomously maintained in the pool within the contract itself and automatically converted into a liquidity pool. As the token matures, the self -liquidity can be attributed to increasing market stability capable of absorbing large market activity.

2.2 Reflection

POOL TOKEN implemented the concept of static rewards, also called reflections. This concept can help eliminate the danger of falling into a

liquidity-producing trap. Furthermore, the reflection mechanism encourages owners to hold onto their tokens. This is an effect of providing higher percentages of profits based on the number of tokens held.

5% of all transactions go back to holders, automatically by smart contract . So the simple fact of owning the POOL TOKEN has high long-term value and rewards investors with significant profits.

2.3 Transaction Fee

Each new transaction is taxed at 10%, and this percentage is split into two different parts. Both parts consist of 5%. From the first part, all existing holders receive an equal share of the 5%.

The other 5% is then split again into two equal parts, where 2.5% is sold to BNB, while the additional 2.5% is WBNB and then added as liquidity.

3-POOL TOKEN Tokenomic

The project was launched with a total supply of 30,000,000 tokens, where 20,000,000 were placed in pre-sale and 10,000,000 placed in a DEV wallet, where after the pre -sale sale it will be divided into :

3,000,000 Marketing Portfolio

2,500,000 Development portfolio

1,000,000 DEV Portfolio 1

1,000,000 DEV Portfolio 2

1,500,000 Programming Portfolio

1,000,000 Administrative portfolio

4-POOL TOKEN Investments

4.1 - Retaining the POOL TOKEN itself generates income. 5% of all transactions go back to the holders in proportion to the amount of tokens.

4.2 - Staking on the source platform (Pool party Finance), or on other platforms.

4.3 - Profitable Syrups , where POOL TOKEN is deposited to receive other cryptocurrencies.

4.4 - Farms , where the POOL TOKEN belongs to the LP token in question, not just on the Pool Party origin platform Finance but also on other platforms.

4.5 - Trade of the POOL TOKEN itself.

Investing in Syrups for Pool Party Optimization finance , making it more attractive, will also be financed by part of the POOL TOKEN collection.

6 - Pre - sale collection

For Sale = 20,000,000 POOL

Min Cap = 100 WBNB / 100% (min cap)

Max Cap = 1,500 WBNB / 1500% (max cap)

Minimum Contribution = 0.1 WBNB

20% - buyback and burn MSC / Liquidity

20% - team (programmers, developers)

40% - development of the pool party platform finance

20% - marketing

Pool can be purchased at any DEX, starting from the contract;

-Contract:

0x30f11795b21b5efc1a2ded78d04574d0e36442bd

Based on each transaction, there is a tax. Redistribution comes from this tax and the same for liquidity. This automatic redistribution can promote scarcity, reducing the total supply, being 10% slippage with Pool Token, where 5% is distributed to Holders and 5% is added as liquidity.

-TOKEN CUNHAVÉL – MSC

passive income token

Through MSC (music coin) you can earn extra income with passive income through farms , syrups and stake .

be purchased on any DEX, starting from the contract;

-Contract:

0x9c9ac8b098a7d47ed1834599ce2dc29cb94103e9

There is no fixed maximum mint of MSC tokens, which allows the supply to fluctuate as needed, making it inflationary. While there is no cap, there is a block-controlled issuance mechanism and regular quarterly token burning, which allows to reduce token price inflation.

MSC is a token that seeks to stimulate liquidity on DEX. If such a token did not exist, there would be no incentive for users to add liquidity.

-ZAV Token – DEFI game/ metaverse token

Third generation token, ZAV will be the payment token for DEFI GAME.

Fixed supply of 40 million tokens.
